SKYE BENEFITS

- Mid to late primocane, starts cropping between Kweli and Kwanza
- Long cane appears well suited to double cropping

Skye is a mid-late autumn, primocane raspberry, highly productive and with high potential to double crop with exceptional fruit quality. The colour is a mid to light red which is maintained after picking. It has great size, shape and flavour. The vigour of the variety is considerable and the canes grow to a good height. The combination of this vigorous growth habit and fruit quality make it adaptable to both summer and autumn harvesting so the variety can be readily double cropped.

- Excellent feedback on fruit quality
- Large fruit, highly productive, displayed well for easy picking

Skye has a low chill requirement similar to Kweli and Imara. Plants produce tall, vigorous long cane with a short internode distance. Canes produce a high number of fruit/lateral which de-plugs easily. Skye shows promise as a double-cropping variety, producing consistently high-quality fruit with high yield potential in both crops. The combination of high yield potential and the ease of pick can contribute to reducing picking costs.

SKYE REVIEW

"Skye produces a double crop with a balance of productivity and consistent fruit quality in both crops. Growers will appreciate the improved picking efficiency of Skye with the combination of productivity and large fruit size that can be picked easily and quickly from the plant. Skye has scored highly in blind tastings in public events."
